## Abstracts

A retractor is a surgical instrument used to separate the edges of a surgical incision or wound, or to hold back underlying organs and tissues so that body parts under the incision may be accessed. Spinal retractor provides focal and dependable retraction in the space between the transverse processes. This exposure facilitates a transforaminal decompression, pedicle fixation, and intertransverse fusion in those patients in which an open approach is indicated. The system easily adapts to single or multilevel situations.
