Summary

Spinal trauma refers to a severe injury to the spinal cord and requires the fixation of spinal trauma devices to treat bone deformities, facilitate bone fusion, strengthen and stabilize the spinal cord, and prevent further damage and complications. The products are involved in removing the damaged disc and replacing it with any fusion products. Non-fusion products are used during spine surgery, which are implanted to treat spine conditions. This also allows the patient to retain its movement and flexibility. The non-fusion products are becoming the treatment of choice, especially for the younger, more active patient.
