### Summary

Time delay is defined as the controlled period between the functioning of two events. A Time delay relay is a combination of an electromechanical output relay and a control circuit. The control circuit is comprised of solid state components and timing circuits that control operation of the relay and timing range. Typical time delay functions include on-delay, repeat cycle (starting off), interval, off-delay, retrigger able one shot, repeat cycle (starting on), pulse generator, one shot, on / off delay, and memory latch. Each function is explained in the table below. Time delay relays have a broad choice of timing ranges from less than one second to many days.

There are many choices of timing adjustments from calibrated external knobs, DIP switches, thumbwheel switches, or recessed potentiometer. The output contacts on the electromechanical output relay are direct wired to the output terminals. The contact load ratings are specified for each specific type of time delay relay.
