Abstracts

Since many years now, the United States has remained the biggest producer of petroleum and natural gas in the world. The country's production of hydrocarbons exceeds that of both Saudi Arabia and Russia. US' petroleum production has gone up by over 10 quadrillion Btu since 2008, with growth coming primarily from North Dakota and Texas.

The US contains only about 2.5% of the world's known natural gas reserves. Natural gas consumption has been growing rapidly, and this demand has pushed prices to very high levels. Nearly 20% of US electricity is generated at gas-burning plants, so the cost of natural gas has hurt electricity consumers in many parts of the nation. At the same time, however, the US sits on immense quantities of coal, about 25% of the world's reserves. America's 1,300 coal-fired electric plants already create about one-half of the nation's electricity, and technologies that enable coal to be burned in a cleaner manner will be adopted across the nation. However, the price of coal has been soaring in the US, along with the cost of oil and gas.
