1. INTRODUCTION

Ethanolamine is an organic chemical compound with the formula $\text{HOCH}_2\text{CH}_2\text{NH}_2$. The molecule is both a primary amine and a primary alcohol. Ethanolamine is a colorless, viscous liquid with an odor reminiscent to that of ammonia. It is used as feedstock in the production of detergents, emulsifiers, polishes, pharmaceuticals, corrosion inhibitors, chemical intermediates.

In 2015, global aggregate capacity of ethanolamine was about 2.3 million tonnes. Global ethanolamine annual output was about 2 million tonnes, the major producing areas distributed in America, Europe, and East Asia. America was the largest ethanolamine production country which manufactured about 890 thousand tonnes annually, account for 38% of the global output. European output was about 620 thousand tonnes, account for 27%.

In China, the quality of domestics produced ethanolamine is not able to satisfy downstream companies' needs. Most high quality product is relying on foreign import. The total capacity of ethanolamine in China is about 500 thousand tonnes per year.
