Abstracts

In general, aluminum foil is the aluminum or aluminum alloy coil being rolled as aluminium strip whose thickness is less than 0.2 mm.

Currently, the thinnest of the commercialization of rolling aluminum foil is 0.0045 mm, and can be produced more thinner. But the cost of this product far exceeds its practical value, which cannot meet the requirement of economical efficiency. Therefore, the thickness of aluminum foil is not the main goal pursuing by the enterprise. How to upgrade the manufacturing technique to realize low cost high efficiency and how to constantly develop new products to meet the various needs of markets are the main problems enterprises facing. Along with the social progress of science and technology, modern aluminium foil production and processing technology is also in constant development, the future development trend mainly can be summarized as: low cost, high efficiency, automation, intellectualization, refinement and large scale."
