### Report Scope:

BCC Research's definition of nanorobots excludes microbes whose metabolic processes are used to manufacture various biofuels, enzymes, specialty and industrial chemicals, and bioplastics, as well as in pollution mitigation and hazardous waste disposal. Nanorobots potentially include both electromechanical devices and biological mechanisms that mimic the functioning of electromechanical machines. Nanobots do not yet exist, but when they do, their potential applications include molecular manufacturing (nano factories) and medical nanobots that steer autonomously through the bloodstream, making repairs and guarding against infection. The term "nanorobots" is widely applied to such microbes, and studies that estimate the near-term market for nanorobots in the billions of dollars are generally defining such microbial factories or waste remediation microbes as nanorobots. From this report's point of view, the relevant distinction is that nanorobots perform a discrete action or task, such as delivering a cancer drug to a targeted tumor. Microbial factories or waste mitigation microbes accomplish their purposes utilizing continuous metabolic or other processes.
