Abstracts

Summary:

The global market for whole genome sequencing is expected to grow from \$3 billion in 2025 and forecast to reach \$6.1 billion by the end of 2030, at a compound annual growth rate (CAGR) of 15.1% from 2025 to 2030.

Whole genome sequencing provides comprehensive information on genes and helps understand the role of coding and noncoding DNA in genetic expression. WGS involves extracting DNA from the organism, building a library, sequencing the DNA fragments and analyzing the data to identify genetic variations. The potential of WGS to offer a base-by-base view of the genome makes it more efficient than other methods, such as whole exome sequencing.

Whole genome sequencing is a promising tool for diagnosing, treating and monitoring many conditions, including cancer, rare inherited disorders, and neurological conditions. This technology's ability to offer comprehensive information about the whole genome can reduce the need for single gene tests or other invasive procedures to diagnose diseases. WGS is increasingly being explored in drug development to identify better disease targets and select suitable patients for a study based on genomic profiling. In drug development, the WGS technology is explored to characterize biomarkers for diseases such as cancer. and Due to its ability to identify variants, such as single nucleotide variants and structural

variants, this technology can play a prominent role in the diagnostics industry in the future.

Market Dynamics and Growth Drivers

The growing research to understand the impact of genetic mutations on the occurrence of cancer, rare diseases, infectious diseases, etc., is driving the demand for WGS technology. Further, the decreasing genome sequencing costs influence market growth. Furthermore, government initiatives to establish genome data banks and healthcare organizations such as NHS (National Health Service) evaluating WGS for cancer diagnosis and treatment monitoring highlight the clinical utility of the technology.

Data analysis and management challenges and a lack of infrastructure in emerging countries hamper the market's growth. The high cost of sequencers and the lack of skilled professionals affect the market in regions such as Asia-Pacific and South America. However, with a growing emphasis on the automation of sequencing operations, WGS workflows can have simplified operations with reduced manual operations.
