The 3D printing prototypes are achieved through various printing materials such as plastics, polymers, metals, ceramics, and others. The 3D printing materials are widely used for the development and production of advanced custom polymers and compounded products. This empowering innovation is driving the 3D printing and advanced manufacturing industry and is carrying them forward with better solutions. The 3D printing processes currently available are substantial for creating prototypes and end use production part in several types of plastics. The technological advancements in additive manufacturing (AM) along with the evolution of 3D printing materials such as plastics, ceramics, metals, and others have significantly impacted the way 3D printing is perceived and relied upon by engineers, designers, and manufacturers during the product development and production processes.

Polylactic Acid (PLA), Acrylonitrile Butadiene Styrene (ABS), Polyether Ether Ketone (PEEK), Polyethylene Terephthalate Modified Glycol (PETG), nylon/polyamide, and Poly Carbonate (PC) are some of the 3D printing plastics widely used in the end user industries. PLA is the most widely used 3D printing plastic filament in the world. It is the recommended 3D printing plastic material to be used for most of the desktop 3D printers. PLA is considered as the easiest 3D printing material to work with at the initial

stage. It is one of the eco-friendliest 3D printing materials available and requires less temperature and energy to process. PLA processing is both easier and safer to use and provides smoother and shinier appearance. PLA can achieve a superior level of print and is less prone to warping. However, when printed with PLA, it is stickier and is prone to jamming the printer nozzle. PLA can be used in the resin form for DLP/SL processes or in the filament form in the FDM process. Shenzhen eSUN industrial Co. Ltd., Polymaker, ColorFabb, 3D Systems, Ninjabflex, Airwolf3D, Matterhackers Inc., and Taulamn3D, are some of the key PLA filament manufacturers in the global 3D printing plastics market.

The global 3D printing plastics market is expected to grow at a CAGR of 20.5% and 21.9% between 2018 and 2023 in terms of value and volume, respectively.
