The global automotive industry is undergoing a period of wide-ranging transformations with a change in the consumer behavior as well as an increase in the implementation of stringent environmental regulations. A rise in the conventional fuel vehicle sales, along with increasing global population and urbanization, has brought with it some serious concerns, such as global warming and alarming pollution levels. There are innumerable issues that are plaguing the planet, and the natural resources (especially fossil fuels) are declining at a rapid pace. This has consequently led the governments, environmental agencies, and automobile manufacturers to develop different modes of transport that run on alternate means.

An electric vehicle fast charging system is an integral part of the electric vehicle ecosystem and is used to charge the battery of electric vehicles faster as compared to other chargers. These chargers supply electric energy to the electric vehicle to charge the battery of battery electric vehicles and plug-in hybrid vehicles. The electric vehicle fast charging system market is majorly driven by the factors such as rise in electric vehicles sales, technological advancement, and increasing push from government for the deployment of highway chargers as well as fast bus chargers. However, factors such as a lack of standardization and the high cost of equipment and installation hamper the overall market growth. Moreover, the transition from conventional energy for

charging system, evolving business models for EV charging, and wide ranging opportunities in developing region are anticipated to create numerous opportunities for the market growth.
