There are different types of healthcare robots that have emerged over a period of time which includes, surgical robots, rehabilitation robots, diagnosis robots, and radiotherapy robots. The surgical segment accounted for the highest share of the market in the year 2017 due to higher adoption rate across various hospitals, recurrent sales of accessories of these systems, and huge demand for highly efficient replaceable components. The overall enhancement in patient outcomes has a positive impact on the growth and adoption rate of the surgical robotics technology. Rehabilitation robots includes robots for providing assistance and therapy to the patients in their daily living tasks and to the patients suffering from stroke or as disable. The recent scenario involves robots that are used for diagnosis through endoscopy procedures. Radiotherapy robots are costly due to their non-invasive surgical procedure used for the treatment of chronic diseases such as, cancer. The scope of advancements in healthcare robots is very wide due to its high potential in the treatment and faster recovery of the patients. Thus, providing physicians and surgeons with the wider interface and platform for better decision making at the time of procedures and treatment.
