The global high-throughput satellite market has exhibited a high growth in the recent past. Currently, the space industry is at the cusp of a major revolution, as a large number of HTS are expected to be launched in the next five years. The HTS market has witnessed a high growth rate owing to the growing need for network connectivity, rise in the demand for high-throughput satellite constellations, and increase in the deployment of high-throughput satellites for commercial end users. The recent innovations in satellite equipment and services enable the HTS technology to reach a wider segment of consumers in the industry. HTS deliver much higher capacity than do traditional satellites at a mere fraction of the cost. This is made possible because HTS are based on spot beam technology, which enables frequency re-use across multiple narrow-focused spot beams. High-throughput satellites offer unique advantages and have a huge potential to serve various application areas such as enterprise network, government, and cellular backhaul, among others.

The following points provide a concrete description of the report content and of the topics covered in the report:
