The global laparoscopy and endoscopy devices market is a combination of two different minimally invasive approaches wherein laparoscopy devices are used in surgical interventions and possess therapeutic applications while endoscopy devices aid in the visualization of anatomical structures and diagnosis of various diseases.

Typically, laparoscopy is a minimally invasive surgical procedure which involves insertion of a laparoscope through a small incision typically between (3-15) mm in the abdominal cavity and enables visualization of abdominal contents. This procedure allows a wide variety of diagnostic and therapeutic procedures to be performed. On the other hand, endoscopy is a non-surgical procedure which involves the insertion of a flexible tube with a light and camera attached to it and enables doctors to visualize/examine the patient's digestive tract.

In addition, endoscopic procedures utilize specialized instruments (endoscopes) to visualize and operate on the internal organs (especially in the gastrointestinal track) as well as blood vessels of the body. Endoscopic procedures are often named on the portion of the inspected digestive track such as upper GI endoscopy (examination of the oesophagus, stomach, and the upper small bowel called duodenum), colonoscopy (inspection of the abnormalities in the mucous lining of the intestine or bleeding in the

colon), and enteroscopy (examination of the small bowel), among others.
