Liquid biopsy is a minimal invasive medical procedure with the ability to detect the presence of molecular cancer biomarkers in the biological fluids. The test principally involves the usage of samples of biological fluids, such as blood, urine, serum, and saliva, and then the analysis of the samples using different techniques, such as next-generation sequencing (NGS) and polymerase chain reaction (PCR) to detect the mutations known to cause cancer. The liquid biopsy tests provide a platform to an oncologist for a non-invasive and highly-sensitive tumor profiling of patients. The test provides actionable information about the patients at every critical stage of the treatment cycle. Liquid biopsy tests help in the early detection of tumor-associated mutations in the blood with the help of ctDNA, thus further helping in the betterment of cancer treatment procedure. Growing geriatric population has significantly necessitated the requirement for novel diagnostic procedures based on minimal invasive procedures. Significant degree of research on molecular technologies, cancer biomarkers, and biomarkers presence in body fluids has opened various pathways for the development of a vital non-invasive diagnostic procedure as liquid biopsy.
