Abstracts

Global Animal Biotechnology Market is valued approximately USD 22.66 billion in 2021 and is anticipated to grow with a healthy growth rate of more than 9.2 % over the forecast period 2022-2028. Animal Biotechnology is the use of Science and Technology for developing genetically which are appropriate for pharmaceutical, industrial or agricultural applications. Increment in various animal diseases, large investment in research and development activities from both public and private firms, an increasing number of initiatives and campaigns are implemented by the government to promote animal health. According to Veterinary Cancer Society, 1 in 4 dogs will suffer from cancer at some point, and almost 50% of dogs over age 10 will develop cancer, According to a survey conducted by the Pew Initiative on Food and Biotechnology in 2018, 58 percent people opposed scientific research on the genetic engineering of animals. According to the study published in Frontiers in Bio-engineering and Biotechnology, titled 'Applications of Nanovaccines for Disease Prevention in Cattle' in December 2020, vaccines are one of the most effective strategies for preventing and

controlling infectious illnesses in cattle. Nanoparticle-based vaccine platforms (nano vaccines) have recently gained traction as viable alternatives to more traditional vaccine platforms. The wide use of vaccines to prevent and control animal diseases is therefore expected to drive market growth. Also, enhanced nutritional content of food for human consumption, a more abundant, cheaper and varied food supply, agricultural land-use savings, a decrease in the number of animals needed for the food supply, the global Animal Biotechnology market is likely to increase the market growth during the forecast period. However, the unknown potential health effects to humans from food products created by transgenic or cloned animals
