Abstracts

The global Anti-radiation Drugs Market was valued at approximately USD 4.11 billion in 2023 and is anticipated to grow with a healthy growth rate of more than 9.9% over the forecast period 2024-2032. Anti-radiation drugs offer protection against radiation exposure. These drugs include KI, Prussian Blue, and DTPA (Diethylenetriamine pentaacetate). Anti-radiation medicines help block the absorption and subsequent concentration of radioactive iodine in the thyroid gland. KI must be consumed before or shortly after exposure to radioactive iodine for better results. It is effective only against radioactive iodine and not against other types of radiation. Oxidation of ferrous ferrocyanide salts produces Prussian blue, which is used for the treatment of thallium poisoning or radioactive cesium poisoning.

The high prevalence of cancer and Acute Radiation Syndrome (ARS) is driving the anti-radiation drugs business. Potassium iodide (KI), an anti-radiation drug, provides some protection in cases of radiation exposure. The rise in concerns regarding the usage of nuclear weapons in wars is expected to augment the demand for anti-radiation pills. Detonation of a nuclear weapon may lead to the release of radioactive iodine. Biotechnology firms are receiving government contracts to develop drugs for the

treatment of ARS. Vendors in the anti-radiation drugs sector are investing significantly in expanding their production capabilities. They are also launching new products to broaden their Anti-radiation Drugs Market share.

The key regions considered in the study include Asia Pacific, North America, Europe, Latin America, and the Middle East and Africa. North America is the dominating and fastest-growing region in the Anti-radiation Drugs Market. This leadership is driven by several key factors. The region's advanced healthcare infrastructure, coupled with significant government investments in defense and emergency preparedness, has spurred demand for anti-radiation drugs. The United States, in particular, has seen substantial funding directed towards stockpiling and research of these drugs as part of national security measures against potential nuclear threats or radiological emergencies. Additionally, the presence of leading pharmaceutical companies and research institutions in North America contributes to rapid advancements in drug development and commercialization. The increasing awareness of radiation risks, both from potential nuclear incidents and from medical radiation exposure, further boosts the market. Regulatory support and accelerated approval processes for emergency use drugs also play a crucial role in the region's dominance and fast-paced growth in the global Anti-radiation Drugs Market.
