Abstracts

Global Bovine Mastitis Market is valued approximately at USD XX billion in 2020 and is anticipated to grow with a healthy growth rate of more than 5.1% over the forecast period 2021-2027. Bovine mastitis is a health condition that affects dairy animals which causes inflammation of the mammary gland and udder tissue. The illness can harm the cattle's milk-secreting tissues, which is one of the main reasons why it's considered a significant problem. The growing global prevalence of bovine mastitis will have a direct influence on the overall market's growth in the future years. Furthermore, mastitis is a hazard to human health since it can cause zoonoses and food toxin infections. The market is being driven by increase in product launches for animal healthcare and rise in the incidence of disease. For instance, the launch of a new medicine to protect dairy cattle from immunological illnesses was announced by Boehringer Ingelheim International GmbH in October 2018. The company launched 'Lockout,' a treatment that will help dairy cattle avoid post-immunotherapy problems, boosting their health and performance. This will also enhance the final products from dairy farming. However, lack of awareness about disease may impede market growth over the forecast period of 2021-2027.

North America is found to hold a significant share of the bovine mastitis market due to the strong adoption of intra-mammary infusion products for the treatment and the

presence of leading players in the region offering a wide range of products for the control of the infection. It is expected to show a similar trend over the forecast period, with no significant fluctuations. The presence of large-scale companies in North America will have an impact not only on the regional market growth but also on the global market growth.
