Abstracts

Chemical detector is an instrument or a test that includes qualitative and quantitative procedure designed to verify the existence of a chemical compound. Chemical detection serves variety of purpose such as to verify the requirements of a specification or regulation, Determine the interactions of a sample with the environment and other substances, to determine and verify the composition of a sample. It also provides standard data to quality control and Quality assurance department. Market is expected to grow with a CAGR of 18% globally. Basically, chemical detection technology is used in for detection of chemical agents, toxic industrial materials, toxic industrial chemicals. Thus, majorly this technology helps in for monitoring of major chemical plants and industries. Major example of this can be Bhopal gas tragedy which have activated alarm in foremost chemical industries to benefit in for using the finest quality and dependable chemical detection technology. Most of the commercially available such as CA and TIC technology detects and utilize technologies which are majorly adapted from classical analytical chemistry technologies. During the forecasted period this technology is increased by 4.6% globally which is in the decreasing mode but this technology is said to increase in the coming years as it is used by every big and foremost company. Due to heavy loss of chemicals in Bhopal gas tragedy, chemical industries are using these technologies and playing safe in global market.

Air population is thus professed as modern day to day working, as by increase in

urbanization and industrialization in major cities and governments don't have proper way to dispose these gases which in fact increases air pollution which is said to be more dangerous as it directly affects human lungs and end up with various diseases. Air pollution occurs with indoor (household), and for outdoor there is (environment) problems. According to the report from WHO in May 2016 around 80% population who are living in specific urban areas those are monitoring problems regarding air pollution are unprotected with specific air quality which have thus exceeded the limits of WHO which is dangerous for humans. As all the regions of the world are affected by this problem, majorly those cities are affected where there is low income of population or those who stay near to villages. These are the major areas those are affected with air pollution. According to urban air quality database almost 98% of major cities those come under low and middle-income countries and those are with more than 1,00,000 residents does not come under the user guidelines of WHO air quality. Apart from this country with high income have thus decreased their percentage by 56%. Thus, air pollution is the major cause for lung and other major diseases which may cause to death. Globally highly populated cities in all major countries are now using air pollution control methods so as to control city pollution and can work on methods to cure it so as to get better results globally.
