Abstracts

Global Edge Computing Market is valued at approximately XX in 2021 and is anticipated to grow with a healthy growth rate of more than xx% over the forecast period 2022-2028. Edge computing assist the organisation by allowing a wide collection of stakeholders to manage IT infrastructures, networking, software development, traffic distribution, and service administration. Edge also blends software and hardware solutions, as well as networking architecture, to address a wide range of corporate use cases. Edge computing is in its early stages of development. Although its deployment and operating models have yet to emerge, edge computing is likely to offer considerable growth opportunities for new entrants in the coming years. The growth of IoT has resulted in a large rise of data, causing organisations to rely on centralised cloud computing and storage solutions. The global IoT solution and services market is predicted to grow at a double-digit CAGR of 14.9 percent between 2020 and 2025. A research report predicts that the number of active IoT devices will reach 31 billion by 2025. Rising customer demand and different technology breakthroughs have resulted in the expansion of infrastructure for autonomous and connected vehicles. Autonomous vehicles transmit weather, light, and road conditions and use that information to

navigate, control, and drive. Edge computing has great prospects to enhance the progress of autonomous cars by making processing faster and closer to the source of data. Enterprises are fast embracing digitalization by implementing innovative technology to efficiently automate and speed their business processes. Edge computing may cut data transport and storage costs through localised processing, but investing in edge infrastructure still increases organisations' CAPEX. Companies seeking comprehensive edge computing solutions would need to make significant investments in edge nodes, other edge devices, and edge data centres.

The key regions considered for the global Edge Computing market study include Asia Pacific, North America, Europe, Latin America, and Rest of the World. North America will have the highest revenue share. The convergence of IIoT and edge computing is creating favourable conditions for manufacturers in the United States to transition to connected manufacturing. Asia Pacific contributed a sizable sales share, owing to a greater emphasis on strengthening networking technologies in the region as a result of the COVID-19 pandemic. Because of the region's tremendous expansion of the connected device ecosystem, a large amount of data is generated, necessitating the need for a strong computational infrastructure.
