Abstracts

Global High Content Screening Market is valued approximately USD 824.58 million in 2021 and is anticipated to grow with a healthy growth rate of more than 10.3% over the forecast period 2022-2028.

High-content screening is also known commonly as cell omics or high-content analysis. It is a procedure that is majorly used to detect substances such as RNAi, peptides, or small molecules, which modifies a cell's phenotype in an ideal way during drug discovery and biological research. In this method, cells are initially created with the substance and after a point of time, measures, and molecular components of the cells are analyzed. The growing public and private investments in emerging markets, rising developments in informatics solutions and imaging instruments, availability of government funding, coupled with the thriving growth of the pharmaceutical sector are the primary factors that are stimulating the global market growth. For instance, as per India Brand Equity Foundation, 2018, the Indian government intended to invest USD 640 million in funds for increasing the drug discovery and pharmaceutical infrastructure.

The initiative 'Pharma Vision 2020' of the Indian Government aimed to create India as a leading hub for drug discovery. Thereby, rising government investments for the drug discovery and development of the pharmaceutical sector are surging the market demand. However, high prices of HCS instruments and lack of knowledge, and shortage of skilled operators of HCS instruments impede the growth of the market over the forecast period of 2022-2028. Also, the increasing number of CROs providing HCS services and rising application of HCS in personalized medicine is anticipated to act as a catalyzing factor for the market demand during the forecast period.

The key regions considered for the global High Content Screening market study include Asia Pacific, North America, Europe, Latin America, and the Rest of the World. North America is the leading region across the world in terms of market share owing to the region's developments of novel technologies, and R&D expenditure. Whereas, Asia-Pacific is anticipated to exhibit the highest CAGR over the forecast period 2022-2028. Factors such as the increasing number of government initiatives, and rising investments in research activities for drug discovery would create lucrative growth prospects for the High Content Screening market across the Asia-Pacific region.
