Global Industrial Control & Factory Automation Market is valued approximately USD 123 billion in 2020 and is anticipated to grow with a healthy growth rate of more than 8.2% over the forecast period 2021-2027. In the manufacturing business, industrial control and factory automation is a growing trend that provides smart production infrastructure. Cost efficiency, quality of production, standardization, dependability, and flexibility in the manufacturing process are all enhanced by industrial control and factory automation. It is made possible by the combination of mechanical components and devices, as well as information technology, is ideal for industrial control and factory automation. In the forecasting years, new applications such as heating, ventilation, and air conditioning (HVAC), electronic power distribution systems, and human machine interface (HMI) will drive up demand for industrial controls and automation. Over the last several decades, technological advancements in process monitoring, industrial automation, and control have significantly improved the productivity of all manufacturing industries around the world. The industrial controls and factory automation industry has benefited from a combination of smart mechanical technology and IT technologies. These systems are utilized in the manufacturing industry to provide a uniform and consistent production environment. Automation in industrial operations has several

advantages over traditional human processes, including cost savings, decreased feedback, faster output, waste reduction, production monitoring, and management. Several mechanical devices have been combined with IT systems to improve automation outcomes. Enterprise Resource Planning (ERP) software tools are boosting the market in expanding its service offerings. It is committed to providing clients with higher-quality, standardized, and trustworthy products on time and at a reasonable cost. Industrial equipment and devices use a variety of interfaces, technologies, and protocols to interact. According to the Occupational Safety and Health Administration (OSHA), due to the implementation of safety components and industrial automation, the prevalence of major workplace injuries and diseases has decreased considerably from 3.3 per 100 employees from 2018 to 2019. However, due to the lack of standardization in various communication interfaces and protocols, data may be misrepresented. The lack of technology standards makes system integration more difficult and prevents the use of the plug-and-play functionality for unrelated systems. This is expected to limit the market growth. For instance, most equipment manufacturers utilize their own interface protocols for interacting with their devices, which creates communication issues for devices created by other manufacturers.

The main regions of Asia Pacific, North America, Europe, Latin America, and the Rest of the World are included in the geographical analysis of the worldwide Industrial Control & Factory Automation market. Since this construction sector, which is the key end user of industrial control and factory automation, is developing at a healthy rate, APAC has been a major contributor to the market's growth. The use of industrial automation and factory automation components and systems, such as SCADA, DCS, industrial sensors, and industrial robots, is aided by the rising population in this region's emerging countries, as well as environmental awareness. The adoption of industrial control and factory automation in the region is being aided by the growth in sustainable construction development and government attempts to regulate energy-efficient practises across the commercial sector. However, the regional market is likely to shrink due to the COVID 19 pandemic, which has interrupted both existing and future infrastructure development projects. However, with a steady recovery of the general economy, this loss is projected to be restored in the forecasting years.
