Abstracts

Global interferons market is valued approximately at USD XX billion in 2020 and is anticipated to grow with a healthy growth rate of more than 5.7% over the forecast period 2021-2027. The interferons are biopharmaceuticals made from live creatures like microbes and animal cells that have a high therapeutic value. The market revenue is generated by selling of several types of interferons, such as alpha, beta, and gamma interferons. The market is driven by the key factors such as high target affinity and specificity of interferons and increasing prevalence of diseases such as hepatitis, multiple sclerosis, and cancer. According to a World Health Organization (WHO) report published in April 2020, 296 million individuals were living with chronic hepatitis B infection in 2019, with 1.5 million new infections every year. Globally, the anticipated number of people with multiple sclerosis (MS) is expected to reach 2.8 million by 2020. Therefore, the high and increasing prevalence rate of these infectious diseases resulted in the high demand for the interferons market. However, High R&D Costs, may impede market growth over the forecast period of 2021-2027.

North America is dominating the interferon market globally, owing to people' increased awareness of advanced treatment techniques, as well as the region's strong medical and healthcare infrastructures and availability of specialists. As a result, demand for interferons will be much greater in the North American region, where the patient population is growing faster than in other nations. However, Asia Pacific is fastest growing region in the upcoming years owing to the advancement in healthcare infrastructure.
