Abstracts

Global Latent Tuberculosis Infection Detection Market is valued at approximately USD XX billion in 2021 and is anticipated to grow with a healthy growth rate of more than XX% over the forecast period 2022-2029. Latent Tuberculosis Infection (LTBI) is a variety of TB infection in which bacteria remains inactive specifically bacteria that exists in the sleeping state inside the individual's body. The detection of this infection is identified by the tuberculin skin test (TST). The risk is increased by other diseases including drug abuse, HIV, or medications that weakens the immune system. Factors such as surging demand for tuberculosis testing, growing funding to manage disease treatment, and increasing geriatric population are driving the market growth globally.

The rising risk of developing active TB from latent tuberculosis infection (LTBI) is propelling the demand for market across the globe. According to TBfacts.org, in 2021, about 40% of Indians are estimated to be infected with the TB bacteria, with the great majority having latent TB instead of active TB disease. Likewise, according to the Centers for Disease Control and Prevention report 2021, it was estimated that up to 13 million people in the United States suffered from latent TB infection. Therefore, the high prevalence rate of latent tuberculosis infection among the population is augmenting the market growth. Furthermore, growing awareness campaigns conducted by non-government bodies and market players, as well as a rising number of government initiatives to treat LTBI are leveraging multiple opportunities in the foreseen years.

However, the lack of a systematic approach to screening tuberculosis and the unavailability of proper recommendations and reimbursement policies are hindering market growth throughout the forecast period of 2022-2029.

The key regions considered for the Global Latent Tuberculosis Infection Detection Market study include Asia Pacific, North America, Europe, Latin America, and the Rest of the World. North America dominated the market in terms of revenue, owing to the growing awareness about early diagnosis of infection, high funding for tuberculosis management, and improvement of healthcare facilities. Whereas, Asia Pacific is expected to grow at the highest CAGR during the forecast period. Factors such as high infection rates in developing countries, increasing population, as well as government favorable initiatives are burgeoning the market growth in the forecasting years.
