Global Lung injury Market is valued at approximately USD XX billion in 2020 and is anticipated to grow with a healthy growth rate of more than XX % over the forecast period 2021-2027. Lung injury is a condition in which the endothelial and epithelial barriers of the lungs are disrupted. Noncardiogenic pulmonary edoema causes ALI and ARDS, which are life-threatening forms of respiratory failure characterized by diffuse bilateral lung damage and severe hypoxemia. It's also a major cause of death and morbidity in critically ill patients who don't have any signs of hydrostatic pulmonary edoema. Severe shortness of breath, low blood pressure, confusion, and intense exhaustion are all symptoms of acute lung damage. With a high occurrence rate over the world, this form of injury has a substantial influence on public health. The rise in the incidence of lung-related disorders and the increase in the geriatric population are driving the worldwide lung injury market forward. Furthermore, rising knowledge about the treatment of acute lung injury (ALI) or acute respiratory distress syndrome (ARDS) is likely to boost the worldwide lung injury market significantly. The global lung injury market is being driven by a growth in the prevalence of lung-related disorders and an increase in the elderly population. Furthermore, the worldwide lung injury market is expected to benefit from increased awareness about the treatment of ALI or acute respiratory distress syndrome (ARDS). Pipeline medications for ALI that are in the last stages of clinical trials are projected to offer potential growth possibilities for the market. These medications are expected to be available in the market within the next few years, providing a lucrative opportunity for market expansion during the projection period. However, complications associated with the use of therapies and low adoption rate due to these complications may impede market growth over the forecast period of

2021-2027.

The regional analysis of the Global Lung injury Market is considered for the key regions such as Asia Pacific, North America, Europe, Latin America, and Rest of the World (ROW). Asia Pacific is the leading region across the world in terms of market share due to presence of large population base, increase in awareness associated with lung injury treatment, and rise in healthcare expenditure in the region. Whereas North America is also anticipated to exhibit the highest growth rate over the forecast period 2021-2027, due to surge in incidence of pulmonary infections across the region.
