## **Abstracts**

Global Mammalian Cell Fermentation Technology Market is valued at approximately USD 39.49 billion in 2022 and is anticipated to grow with a growth rate of more than 8.64% over the forecast period 2023-2030. Mammalian cell fermentation, is widely used to create a variety of biosimilars, enzymes, vaccines, and other biologics. It is an essential step in the development of biopharmaceuticals. Mammalian cells are cultured in a bioreactor for fermentation after being produced in vitro from stem cells. The essential byproducts are produced during this process by the cells using a variety of metabolic pathways. The market for Mammalian Cell Fermentation Technology is driven due to factors such as growing prevalence of chronic diseases, growing need for novel and secure therapies and the growing demand for biologics and biosimilars.

Additionally, the rising prevalence of various chronic diseases including cancer is driving the market growth as cancer treatment often involves the use of biologics such as

monoclonal antibodies, therapeutic proteins, and vaccines. Mammalian cell fermentation is a crucial method for producing these complex biologics. The demand for biologics rises due to the rising prevalence of cancer, which, in turn, drives the need for mammalian cell fermentation technology. According to the International Agency for Research on Cancer (IARC), it is estimated that there was an increase in the global burden of cancer in 2021 approximately 1.9 million new cases have been recorded, which is projected to account for 27.5 million new cases by 2040. Thus, this factor is propelling the demand for the development of personalized medicines, resulting in market growth. The demand for biologics and biosimilars is driving the market for mammalian cell fermentation technology. These therapies are essential for addressing a number of disorders, such as cancer, autoimmune diseases, and various chronic diseases. In May 2022, Biocon Biologics Ltd. and Viatris Inc. received approval from Health Canada for Abevmy (bevacizumab), a biosimilar to Roche's Avastin (bevacizumab), across four cancer indications. Consequentially, the rising development of biologics and biosimilars is driving market growth. Furthermore, rising technological advancement, as well as the increasing research and development spending by pharmaceutical companies are creating new opportunities to the market. However, the high cost associated with the development of technology is restraining the market growth in the forecast period 2023-2030.

The key regions considered for the Global Mammalian Cell Fermentation Technology Market study include Asia Pacific, North America, Europe, Latin America, and Middle East & Africa. North America dominated the market in 2022 with largest market share owing to the region's strong biopharmaceutical industry presence, supportive government regulations, and well-developed healthcare infrastructure. Additionally, the increased demand for biologics and biosimilars as well as the rising prevalence of chronic diseases have contributed to the expansion of the market in the region. Asia Pacific is expected to a fastest growing region during the forecast period, owing to factors such as a big patient population, increasing demand for biologic pharmaceuticals, government initiatives to support biotechnology research and development, and a growth in contract manufacturing organizations (CMOs) in the region, are driving this expansion.

Major market player included in this report are:

Thermo Fisher Scientific, Inc.

Merck KGaA

Danaher Corporation
