Abstracts

Global Perinatal Infections Market is valued at approximately USD XX billion in 2022 and is anticipated to grow with a healthy growth rate of more than XX% over the forecast period 2023-2030. Perinatal infections are infections that occur during pregnancy or shortly after delivery, which can be transmitted from the mother to the fetus or newborn. These infections is generally caused by bacteria, viruses, fungi, or parasites that exhibit a serious impact on both the mother and the infant. Several common perinatal infections include cytomegalovirus infection, enterovirus infection, genital herpes, gonorrhea, human immunodeficiency virus, others. The surging cases of perinatal infections, growing awareness regarding treatment availability, rising number of government initiatives, spurring demand for personalized medicine, rising inclination towards point-of-care testing are the most prominent factors that are propelling the market demand across the globe.

In addition, the rising incidences of Human Immunodeficiency Virus (HIV) are exhibiting a positive influence on market growth across the globe. Pregnant women with HIV

require antiretroviral therapy (ART) to reduce the risk of mother-to-child transmission of the virus. Without proper treatment, the risk of transmission is high and leads to perinatal HIV infection, which can have serious health consequences for the newborn. According to HIV.gov, in 2021 it was estimated that nearly 38.4 million people worldwide are suffering from HIV, of which 1.7 million were children (
