## **Abstracts**

Global Postmenopausal Osteoporosis Market is valued at approximately USD XXX million in 2021 and is anticipated to grow with a healthy growth rate of more than XX % over the forecast period 2022-2028. Osteoporosis is a chronic bone condition that primarily affects postmenopausal women and has a propensity to get worse with ageing. The effects include a loss of bone density and a sharp decline in the integrity of the interior spongy structure until the bone breaks because of being unable to tolerate external pressures and strains. The market growth is driven by key factors such as investment by market players and thereby strong pipeline and increase in geriatric population. For instance, according to WHO, in the period between 2015 and 2050, the percentage of the global geriatric population—those older than 60—is projected to double, rising from 12 to 22 percent. These results demonstrated a steady rise in the number of elderly people who have postmenopausal osteoporosis over the research period (aged between 50 years to 60 years). Furthermore, some of the risk factors for osteoporosis in women after menopause include ageing, smoking, alcohol usage, and the use of drugs to treat various disorders, such as gonadotropins, excessive thyroid hormone use, and cytotoxic agents. More than 200 million women are thought to have osteoporosis, and 1 in 3 women over 50 are predicted to have an osteoporosis fracture, according to research from the International Menopause Society (IMS) released in 2021. Also, with the new product launches and increase in Clinical trials for better diagnostic solutions likely to increase the market growth during the forecast period. However, low awareness

of Postmenopausal Osteoporosis impedes the growth of the market over the forecast period of 2022-2028.

The key regions considered for the global Postmenopausal Osteoporosis Market study include Asia Pacific, North America, Europe, Latin America, and Rest of the World.
