Global Protein Engineering Market is valued approximately USD 2.47 billion in 2021 and is anticipated to grow with a healthy growth rate of more than 12.4% over the forecast period 2022-2028.

Protein engineering is the method of evolving valuable or beneficial proteins with particular structures, or desired properties. This procedure is carried out for understanding protein folding and recognition for protein design principles. Protein engineering gains huge traction among various verticals such as contract research organizations, biopharmaceutical companies, academic research institutes, and many others. The growing incidences of protein-deficient diseases, increasing penetration of protein drugs over non-protein drugs, and rising investments in synthetic biology are the primary factors that may accelerate the market growth across the globe. In addition, developments of the product by the leading company, rising number of government funding for protein engineering coupled with growing R&D spendings in the health

industry are further stimulating the market demand in the approaching years. For instance, in 2019, Merck KGaA involved into a license agreement with Amunix Pharmaceuticals, Inc. (US). The aim of this agreement is Amunix received the rights to develop its therapeutics by the adoption of protease-triggered immune activator (ProTIA) technology platform. Also, in 2019, Agilent Technologies acquired BioTek Instruments that enable the company to develop its proficiency in cell analysis and establish its position in the immuno-oncology and immunotherapy markets. However, the lack of skilled professionals to strategize the processes and the high cost of instruments impedes the growth of the market over the forecast period of 2022-2028. Also, increasing investments in the research and development activities and development of the emerging economies is anticipated to act as a catalyzing factor for the market demand during the forecast period.

The key regions considered for the global Protein Engineering Market study include Asia Pacific, North America, Europe, Latin America, and the Rest of the World. North America is the leading region across the world in terms of market share owing to the rising R&D expenditure, availability of novel technologies and instruments for drug discovery research, and presence of major market players in the region. Whereas, Asia-Pacific is anticipated to exhibit the highest CAGR over the forecast period 2022-2028. Factors such as government initiatives and funding for protein-based drug research, as well as developments in genomics and proteomics research, would create lucrative growth prospects for the Protein Engineering Market across the Asia-Pacific region.
