Abstracts

Global Retinoblastoma Treatment Market is valued approximately at USD XX billion in 2020 and is anticipated to grow with a healthy growth rate of more than 4.56% over the forecast period 2021-2027. Retina is the third-inner layer of the eye, responsible for light and colour detection. Retinoblastoma is a rare malignancy that affects the retina, most commonly in children. The exact origins of retinoblastoma are unknown; however, evidence shows that a family history of the disease is a major factor in its transfer to kids. Retinoblastoma is most commonly found in one of the eyes, although it can also affect both eyes in rare circumstances. Leukocoria (whiteness in the pupil), strabismus (crossed eyes), redness, colour blindness, and impaired vision are all symptoms of retinoblastoma. Retinoblastoma can be healed if treated at the first stage. The market is driven by key factors such as increasing public awareness and remission and the chance of recurrence. Furthermore, the availability of better diagnostic tests and treatment options for retinoblastoma drives the market. According to the Japanese Journal of Ophthalmology, the average incidence frequency for retinoblastoma in 2018 was 1:16,823 births/year, with 89.0 percent of patients under the age of 3 years and 41.0 percent under the age of 1 year at diagnosis. However, side effects of retinoblastoma surgery may impede market growth over the forecast period of

2021-2027.

The Asia-Pacific region currently dominates the Retinoblastoma Treatment market and is projected to do so for a few more years. Because retinoblastoma (Rb) is the most prevalent primary intraocular cancer of infancy and childhood, and severely endangers children's eyesight and lives, this region is projected to grow its market share in the future.
