Abstracts

Global Sickle Cell treatment Market is valued approximately at USD XX billion in 2020 and is anticipated to grow with a healthy growth rate of more than 13% over the forecast period 2021-2027. Sickle cell disease is a category of diseases that impair hemoglobin, the molecule that transports oxygenated blood. A deformed red blood cell with the shape of a sickle or crescent is found in people with this disease. Symptoms of sickle cell disease generally begin in early childhood and continue throughout adolescence. Red blood cells break down prematurely as they alter form, which can cause anaemia. The aim of sickle cell anaemia treatment is to reduce discomfort, relieve pain, and prevent complications. Some adolescents and teens are treated with medications and blood transfusions. The market is driven by the increasing research and development activity and increasing prevalence of sickle cell disease. For instance, as per the National Health Institute, over 90% of the world's SCD population resides in three countries: Nigeria, India, and the Democratic Republic of Congo, where the disease affects up to 2% of the population and the carrier prevalence rate (sickle cell trait) is as high as 10% to 30%. However, high cost of treatments may impede market growth over the forecast period of 2021-2027.

Geographically, the sickle cell treatment market in North America is dominated by the United States, which is the market's biggest contributor. Improved access to SCD treatment and potential pipeline medicines are attributed with the region's growth. The substantial government support in the United States will help promote the market's healthy growth.
