Report Overview

A 280 Degree Fire Dampers is a specialized type of fire safety equipment designed to prevent the spread of fire and smoke within a building's ventilation system. These dampers are engineered to automatically close when the temperature reaches 280 degrees Fahrenheit (138 degrees Celsius), which is the threshold at which most fires become uncontrollable. They are typically installed in ductwork and are made from fire-resistant materials to ensure they can withstand high temperatures without failing. The primary function of a 280 Degree Fire Damper is to maintain the integrity of the building's fire compartmentation by sealing off air passages, thus stopping the flow of oxygen to the fire and preventing smoke from spreading to other areas. This helps to protect the occupants, limit property damage, and assist in firefighting efforts. Compliance with building codes and safety standards is crucial, and these dampers are often required by law in commercial and residential buildings to meet fire safety requirements.
