Report Overview

2D laser processing machine refers to equipment that can perform laser processing in a two-dimensional plane. It mainly realizes the rapid capture and processing of the surface shape of an object through the precise projection and reception of the laser beam. The laser beam scans the surface of the object at a certain speed. When the laser beam irradiates the surface of the object, part of the light will be reflected back to the receiver. At the same time, the scanning device records the scanning angle of the laser beam, thereby obtaining the two-dimensional coordinate information of the surface of the object, and then performing precise processing operations.
