### Report Overview

A 3D monocular structured light camera is an imaging system that uses structured light technology to obtain three-dimensional information of the object being photographed. It projects a known pattern of light (such as stripes, dots, etc.) onto the target object, and then uses the camera to capture the deformation of these patterns on the surface of the object. By analyzing these deformations, the spatial geometric information of the object surface can be calculated. This technology is widely used in various fields, including but not limited to robot navigation, gesture recognition, virtual reality/augmented reality (VR/AR), industrial inspection, and facial recognition.
