Report Overview

3D Resin Printers use photopolymerisation technology, which means that the liquid photopolymer is cured by irradiation with ultraviolet light. The UV light penetrates the transparent bottom of the resin barrel and selectively cures the resin. The liquid photosensitive polymer is stacked layer by layer in the barrel, eventually forming the desired model. With each layer printed, the forming platform is lowered to its initial position and the print fixed to the platform is raised as if from a pool of resin.
