Report Overview

A 3D Telecentric Lens is a specialized type of optical lens designed for use in three-dimensional imaging and measurement applications. It is characterized by its ability to maintain a constant image size regardless of the object's distance from the lens, which is a result of its telecentric design. This lens is engineered to have a very narrow depth of field, ensuring that only objects within a specific plane are in focus, while those outside of this plane are blurred. This feature is particularly useful in applications such as machine vision, quality control, and precision measurement, where accurate depth perception and precise focusing are critical. The 3D Telecentric Lens is designed to work in conjunction with 3D cameras and sensors, capturing detailed depth information and creating high-resolution, three-dimensional images. This technology is essential for applications that require high precision and accuracy in spatial data capture, such as in the fields of robotics, automated inspection systems, and advanced manufacturing processes.
