Report Overview

Time-of-Flight (ToF) Depth Cameras are advanced imaging devices that utilize the Time-of-Flight technology to measure the distance between the camera and objects in its field of view. These cameras emit infrared light pulses, which are reflected off objects and captured by the camera's sensor. By calculating the time it takes for the light to travel to the object and back, the ToF Depth Cameras can determine the precise distance to each point in the scene, creating a depth map. This technology is widely used in various applications, including 3D scanning, augmented reality, robotics, and autonomous vehicles, as it provides accurate depth information and works effectively in various lighting conditions. ToF Depth Cameras are known for their robustness, real-time performance, and ability to operate in both indoor and outdoor environments.
