Report Overview

4-Chloro-3-nitropyridine is an organic compound characterized by its chemical structure, which features a pyridine ring with a chlorine atom attached at the 4th position and a nitro group at the 3rd position. Pyridine is a heterocyclic aromatic compound with the formula C_5H_5N , resembling benzene but with one CH group replaced by a nitrogen atom. The addition of a chlorine atom at the 4th position introduces a halogen substituent, which can significantly alter the compound's reactivity and physical properties. The nitro group, consisting of a nitrogen and two oxygen atoms ($-NO_2$), is attached at the 3rd position, further modifying the molecule's electronic structure and potentially affecting its stability and reactivity. This compound is often used as an intermediate in the synthesis of various pharmaceuticals and agrochemicals due to its versatile chemical properties and the ability to undergo further reactions.
