Report Overview

4-Chloro-6-Iodoquinazoline is a halogenated quinazoline derivative, primarily used as a key intermediate in pharmaceutical research and development, particularly in the synthesis of targeted anticancer agents and kinase inhibitors. Its structural properties, including the chloro and iodo substituents, make it valuable for further functionalization in drug discovery, enabling the creation of compounds with enhanced biological activity and selectivity. The compound is of significant interest in medicinal chemistry due to the quinazoline scaffold's prevalence in FDA-approved drugs, particularly those targeting tyrosine kinases involved in cancer progression. Its market demand is driven by the growing emphasis on precision medicine and the development of novel small-molecule therapeutics, with pharmaceutical companies and research institutions being the primary end-users. Supply is concentrated among specialized fine chemical manufacturers, with production requiring stringent quality control due to its application in drug development. Pricing is influenced by raw material costs, particularly iodine derivatives, and the complexity of synthesis. Regulatory compliance, including Good Manufacturing Practices (GMP), is critical for suppliers, given its pharmaceutical applications. Emerging markets in Asia, particularly China and India, are becoming key players in production due to cost advantages, while North America and Europe remain dominant in consumption due to their robust drug discovery sectors. The market is expected to grow steadily, supported by ongoing oncology research and increasing investment in kinase inhibitor development. However, challenges include competition from alternative intermediates and potential supply chain disruptions affecting halogen availability.
