Report Overview

4-(Trifluoromethoxy)benzyl Bromide is an organic chemical compound that can be defined as a derivative of benzyl bromide. This compound is characterized by the presence of a trifluoromethoxy group (CF₃O-) attached to the para position (4th position) of a benzyl bromide molecule. The benzyl bromide part of the molecule consists of a benzene ring with a bromine atom attached to the benzylic carbon (the carbon adjacent to the aromatic ring). The trifluoromethoxy group adds a unique set of properties to the molecule, such as increased lipophilicity and potential reactivity due to the electron-withdrawing nature of the trifluoromethyl group. This compound is often used as an intermediate in the synthesis of various pharmaceuticals and agrochemicals, where its specific functional groups can be further modified to achieve desired chemical properties or biological activities.

In 2024, the global 4-(Trifluoromethoxy)benzyl Bromide market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
