Report Overview

AAV-based gene therapy products utilize adeno-associated virus (AAV) vectors as delivery vehicles to transfer therapeutic genes into target cells for the treatment of various genetic disorders and diseases. AAV vectors are non-pathogenic viruses that can efficiently infect a wide range of cells and have a low immunogenicity profile, making them suitable candidates for gene therapy applications. In AAV-based gene therapy, the therapeutic gene of interest is inserted into the AAV vector's genome, and the vector is then administered to the patient, typically via intravenous injection or direct injection into the affected tissue. Once inside the target cells, the AAV vector delivers the therapeutic gene, allowing it to be expressed and produce the desired therapeutic protein. AAV-based gene therapy products hold significant promise for the treatment of inherited genetic disorders, as well as acquired diseases such as certain types of cancer and neurodegenerative disorders, offering potential long-term therapeutic benefits with a single administration.
