Report Overview

AAV vector-based gene therapy drugs are a class of therapeutic agents used in the treatment of genetic disorders and certain diseases. These drugs utilize AAV vectors, which are small, non-enveloped viruses that have a low pathogenic profile and are capable of delivering genetic material into host cells. The genetic material, which can be a functional gene or a therapeutic gene, is inserted into the AAV vector and then introduced into the patient's cells, where it is intended to correct genetic mutations or produce therapeutic proteins. AAV vector-based gene therapy has shown promising results in clinical trials for conditions such as Leber congenital amaurosis, spinal muscular atrophy, and certain retinal diseases.
