Report Overview

Absorbable bioceramics are a kind of bioceramics that can be gradually degraded and absorbed under the action of physiological environment. After the bioabsorbable ceramic material is implanted into the bone tissue, the material is dissolved and absorbed by the body fluid or excreted by the metabolic system, and finally the defect site is completely replaced by the new bone tissue, while the implanted biodegradable material only acts as a temporary scaffold effect. Part of it is excreted through a series of biochemical reactions in the body, and part of it participates in the formation of new bone. Absorbable bioceramics mainly include P-tricalcium phosphate and calcium sulfate bioceramics.
