Report Overview

An absorbable dural sealant system is a medical device used during neurosurgical procedures to provide a watertight seal over the dura mater, the outermost membrane covering the brain and spinal cord, after it has been incised or punctured. This system typically consists of a synthetic or natural biocompatible material that is applied to the surgical site to prevent cerebrospinal fluid (CSF) leakage, which can lead to complications such as infections or prolonged healing. The sealant material is designed to be gradually absorbed by the body over time, eliminating the need for removal and reducing the risk of adverse reactions. Absorbable dural sealant systems enhance surgical outcomes by promoting effective healing and protecting the central nervous system during the critical post-operative period.
