### Report Overview

An absorbable dural sealant is a biocompatible material used in neurosurgery to seal the dura mater, the outer membrane covering the brain and spinal cord, after it has been incised or torn. This sealant helps prevent cerebrospinal fluid (CSF) leaks, which can lead to serious complications such as infections or prolonged recovery. The absorbable nature of the sealant means it gradually dissolves and is absorbed by the body over time, eliminating the need for removal and reducing the risk of long-term foreign body reactions. In general, there are 2 types of sealants: the synthetic absorbable sealant containing polyethylene glycol (PEG)-based polymers and the biological absorbable sealant containing allogenic or autogenic fibrogen in combination with (allogenic) thrombin.
