Report Overview

Absorbable and Non-Absorbable Sutures are medical devices used in surgical procedures to join or approximate tissues, such as skin, muscles, or organs. Absorbable sutures are made from materials that can be broken down and absorbed by the body over time, such as catgut, polydioxanone, and polyglycolic acid. These sutures are ideal for internal use or areas where long-term support is not required. Non-absorbable sutures, on the other hand, are made from materials that remain in the body indefinitely, such as silk, polyester, and nylon. They are typically used for external wounds or areas requiring long-term support. Both types of sutures play a crucial role in wound closure, tissue approximation, and promoting healing in various surgical applications.
