Report Overview

Absorbable Suture Anchors are medical devices primarily used in orthopedic surgeries, specifically for soft tissue repair and fixation. These anchors are designed to be biocompatible and gradually absorbed by the body over time, eliminating the need for a secondary procedure to remove them. They typically consist of a suture loop and an anchor body made from materials such as polylactic acid (PLA) or polyglycolic acid (PGA), which are known for their strength and bioabsorbable properties. The anchors are inserted into bone to provide a secure point for sutures to be tied, facilitating the reattachment of tendons, ligaments, or other soft tissues. The use of absorbable suture anchors offers several advantages, including reduced risk of infection, improved patient comfort, and a more natural healing process, as the body reabsorbs the material without leaving any foreign remnants.
