Report Overview

Absorbable Suture Material refers to a type of surgical suture that is designed to be absorbed by the body over time after being used to close wounds or secure tissues during surgical procedures. These sutures are typically made from materials such as catgut, polyglactin, polydioxanone, or poliglecaprone, which are biocompatible and gradually degrade as the body's natural healing process takes place. The absorption rate varies depending on the material, allowing for a tailored approach to wound closure that aligns with the healing timeline of different tissues. Absorbable sutures are an essential component in surgical practices, providing a means to maintain the integrity of the surgical site without the need for suture removal, thus reducing the risk of infection and patient discomfort associated with post-operative suture removal.

In 2024, the global Absorbable Suture Material market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
