Report Overview

Accelerator Mass Spectrometry (AMS) systems are advanced analytical instruments used to measure the concentration of rare isotopes in samples with exceptional sensitivity and precision. Unlike conventional mass spectrometers, AMS systems employ particle accelerators to ionize and accelerate atoms to high energies before subjecting them to mass analysis. This technique allows for the detection of isotopes at extremely low levels, making it particularly valuable for applications such as radiocarbon dating, environmental monitoring, archaeology, and biomedical research. AMS systems offer unparalleled sensitivity, capable of measuring isotopic ratios in samples with concentrations as low as parts per trillion or even parts per quadrillion. They play a critical role in unraveling complex scientific questions and advancing our understanding of various phenomena at the atomic and molecular levels.
