### Report Overview

Acellular Dermal Matrix (ADM) is a biomaterial used in various surgical procedures, derived from human or animal skin tissue that has been processed to remove all cells, leaving behind a matrix of collagen and elastin fibers. This matrix serves as a scaffold to support tissue regeneration and healing by allowing the patient's own cells to populate and grow into the structure. ADM is commonly used in reconstructive surgeries, such as breast reconstruction, hernia repairs, and wound healing, because it provides structural support and promotes integration with the surrounding tissue. The acellular nature of the matrix reduces the risk of immune rejection and inflammatory responses, making it a versatile and effective tool in modern surgical practices??.
