Report Overview

Acellular DTP Vaccine, also known as Diphtheria, Tetanus, and Pertussis (DTaP) vaccine, is a combination vaccine designed to protect against three serious bacterial infections: diphtheria, tetanus, and pertussis (whooping cough). This vaccine is formulated using only a portion of the bacteria or toxins, rather than the whole organism, which reduces the risk of adverse reactions while still providing immunity. It is typically administered in a series of doses to infants and young children, starting at two months of age, with subsequent doses at four months, six months, and between 15 and 18 months, followed by a booster dose at four to six years of age. The vaccine plays a crucial role in maintaining herd immunity and reducing the incidence of these potentially life-threatening diseases.
